

## Context

- ## What's an anti-pattern?

## Catalog of anti-patterns

highlights the location where the inconsistency was **discovered**, which might not be the **source of the problem**

**induced by a previously reported error;**  
**not as a direct result of a true error**

**jargon** only relevant to **programming language implementation**

wording can be **misinterpreted** as a **suggestion** of how to fix the error when **no such suggestion is intended**

shows **high density** of seemingly  
**incoherent tokens**

word choices are unjustifiably **harsh**,  
**graphic**, or **extreme**

- N = **297** participants
- Quantitative survey: participants labelled **error messages** from **Java**, **C**, **Python** with **anti-patterns**

- Programmers **clearly perceive anti-patterns**
  - Evidence that **anti-patterns** do exist!
- **Python has fewer anti-patterns** than C, Java

**Becker et al.:** 73 CS1 students: 21% of students believe error messages after the first always correspond to true error. 11% of students believe errors after the first never correspond to true programming errors.

**CPCT+:** on Blackbox 425,812±474 errors reported vs. Panic Mode 981,628

**Denny et al. 2021:** jargon has a strong negative correlation ( $r = .65$ ) with programming error message comprehension.

**Dy and Rodrigo:** 15/28 (54%) **x** **expected** fixed with something other than **x**.  
12/17 (71%) of **;** **expected** fixed with something other than a semicolon.

**Kohn:** 15% of novices insert a comma if presented with missing comma. 25% of novices insert x if given message missing x.

**Barik et al.:** Developers prefer extended arguments over simple claims, but prefer a resolution even more than that.

**Denny et al. 2021:** GCC token soup was 59<sup>th</sup>/60 (second least readable) message.

**Denny et al. 2023:** Codex: 57% (48%) provides correct error message explanations. 47% (33%) provides correct fixes.

- CHARGED TERMINOLOGY: illegal start of expression (90%), illegal start of type (88%)
- COMPILER SPEAK: `SyntaxError: EOL while scanning string literal` (61%)
- IMPLICIT SUGGESTION: `'` expected (90%), `'.class'` expected (90%), `'('` expected (87%), `','` expected (86%), `<identifier>` expected (84%), `expected '` before numeric constant (84%), `expected declaration specifies or '...' before string constant` (81%), `expected expression before 'int'` (81%), `expected declaration specifies or '...' before numeric constant` (78%), `expected declaration specifies before 'if'` (78%), `class, interface, or enum expected` (76%), `expected ';' before int` (74%)
- TOKEN SOUP: `expected '=', ',', ';', 'asm' or '__attribute__'` before `'<'` token (96%)

```

Execution

Standard Error

Compiling playground v0.0.1 (/playground)  
error: expected one of '!', '(', ')', '-', '\*', ',', '::', or '<', found '>'  
--> src/lib.rs:1:40

```
1 | fn multiply_pairs(pairs: &Vec<(f64, f64)>) -> Vec<f64> {
  |                                     ^ expected one of 7 possible tokens
```

error: expected one of '-', 'where', or '{', found '>'  
--> src/lib.rs:1:42

```
1 | fn multiply_pairs(pairs: &Vec<(f64, f64)>) -> Vec<f64> {
  |                                     ^ expected one of '-', 'where', or '{'
```

error: could not compile 'playground' due to 2 previous errors

Execution

Standard Error

Compiling playground\_v0.0.1 (/playground)

error: expected one of '(', ')', '+', '-', '\*', '/', '!', ':', or '^', found '>'  
 -> src/lib.rs:1:40

```
fn multiply_pairs(pairs: &Vec<f64, f64>) -> Vec<f64> {
    ^ expected one of 7 possible tokens
```

error: expected one of '(', ')', '+', '-', '\*', '/', '!', ':', or '^', found '>'  
 -> src/lib.rs:1:42

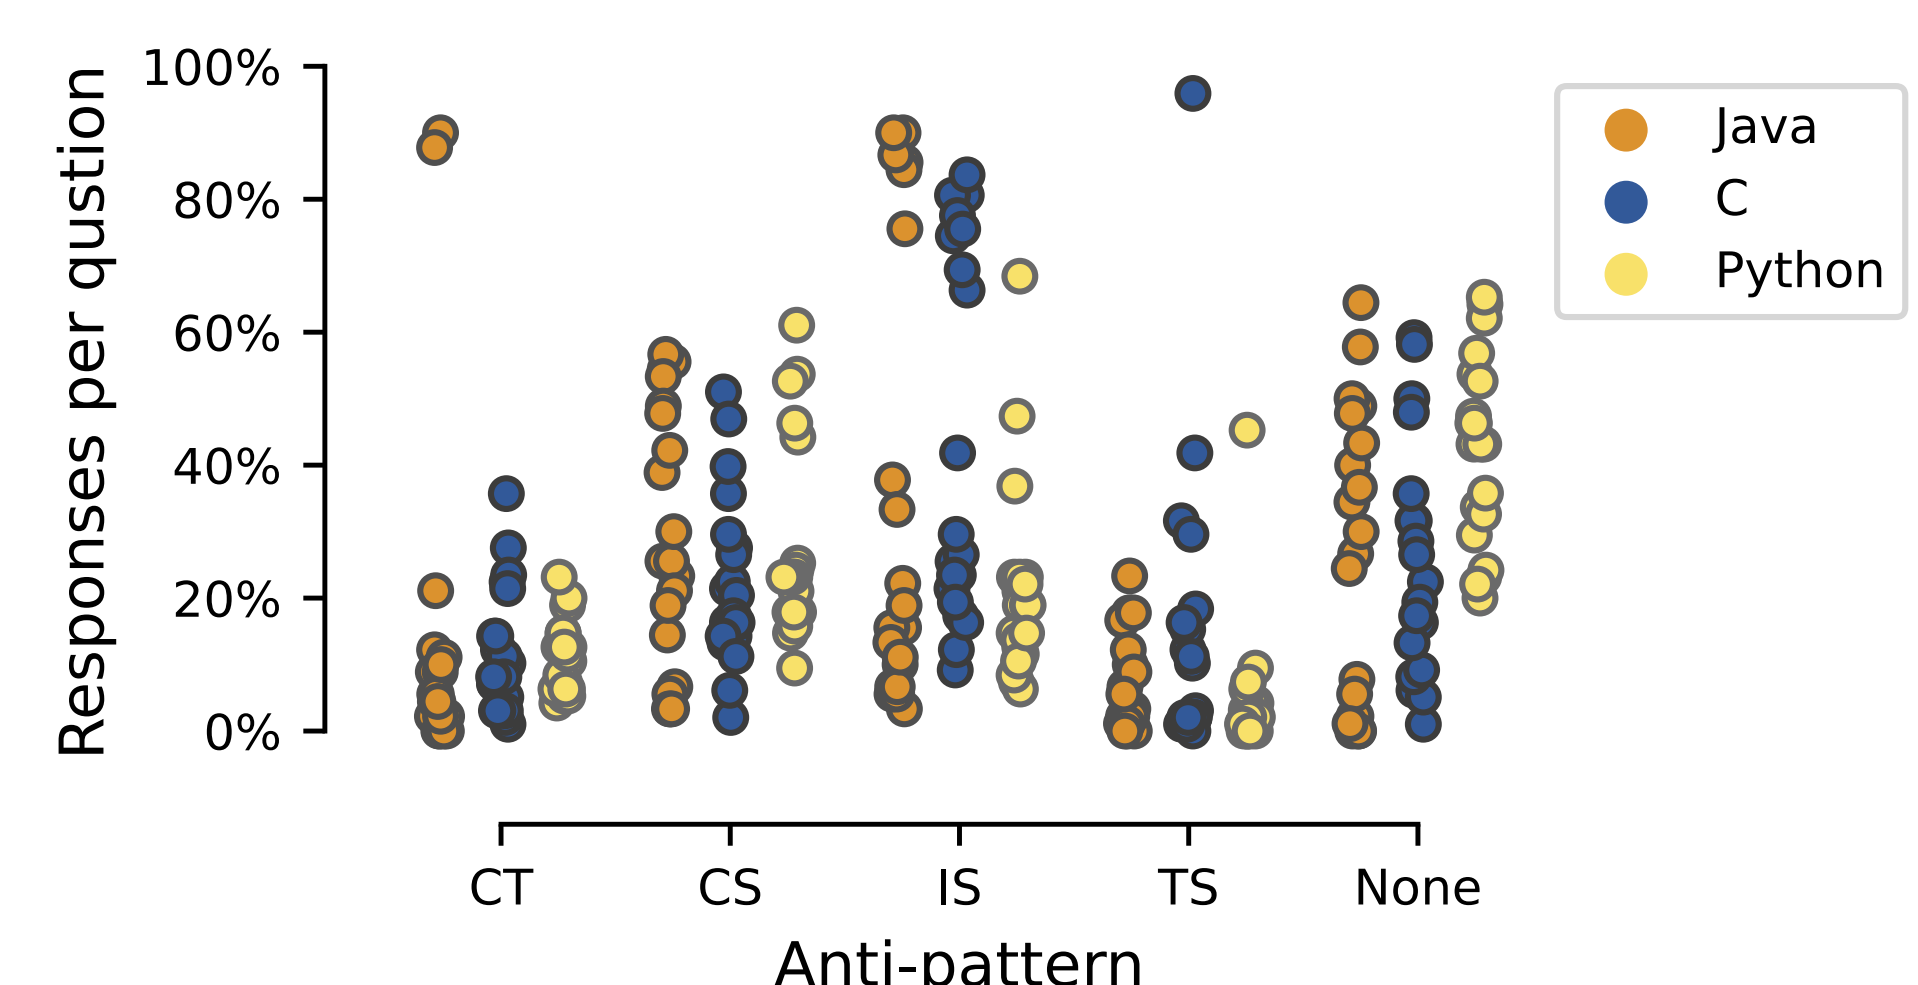

```
fn multiply_pairs(pairs: &Vec<f64, f64>) -> Vec<f64> {
    ^ expected one of '(', ')', '+', '-', '*', '/', '!', ':', or '^', found '>'
```

error: could not compile 'playground' due to 2 previous errors

token soup

implicit suggestion

cascading error
